THE IMPORTANCE OF WATEF AND THE THREATS IT FACES

Water is the lifeblood of our planet. It sustains every life, from the tiniest to the largest lifeforms, includin

We rely on water for drinking, growing food, producin and maintaining nature. Without clean water, life as will end.

Yet, human actions are still putting Earth's water at r Pollution from chemicals, plastics and waste is poisc rivers, lakes and oceans. Our overuse and mismanag water are draining nature's water stores and drying u

Our behaviour is disrupting rainfall patterns, causing in some areas and floods in others. These actions are harming wildlife and ecosystems but also threatenir survival.

TACKLING THE WATER CRISIS

A Call for Change

The water crisis is a complex problem that needs urgent action. However, the existing political set-up has failed to address it effectively. Short-term thinking, lack of cooperation, and the influence of powerful industries, block progress.

Tackling this crisis needs a new approach. Let's harness the wisdom of the crowd in a **Citizens' Assembly**, where a diverse group of people gets together to learn about the issues, discuss solutions and make recommendations.

Unlike traditional politics, these assemblies focus on informed, respectful conversations and long-term thinking. By giving ordinary people a voice, we can create fair and sustainable solutions to protect water for future generations.

Join the movement. Build pressure.
Together, we can restore water and planet

RAW SEWAGE: SOME FACTS

In 2022, raw sewage was dumped into our waterways for a combined 1.75 million hours. An average 825 times per day. Add to that the sewer overflows that are not monitored. Raw sewage contains bacteria, antibiotics, pathogens, viruses & other nasty stuff.

Over an eleven year period, UK water companies have paid out £16.8 billion in dividends to shareholders. Whilst some water companies do identify the position of sewer overflows along rivers and coastlines, little mention is given of what is actually being discharged.

The recreational use of waterways by anglers, rowers, paddle- boarders, swimmers, dog-walkers, boaters and families, means that a major public health threat is growing as a result of these raw sewage dumps. It also has a devastating effect on animal and plantlife.

During times of poor water quality, entering the water can make you ill with eye, ear, skin, throat infections, gastro-enteritis, E.coli, hepatitis & more. If you suffer skin rashes, eye irritation, vomiting, diarrhoea, fever or cold like symptoms and muscle and joint pain, go to your doctor.

For information on where sewage dumps have taken place, check the Outdoor Swimming Society and Surfers Against Sewage websites. Download the Safer Seas and Rivers Service app to check sewage dumping in real time. The Rivers Trust Sewage Map is also useful.
